

Process Flow / SOP

Standard Onboarding Flow

1. Customer or agent submits onboarding request.
2. System validates mandatory fields.
3. If mandatory fields are missing, request remains in Draft / Incomplete state.
4. If fields are complete, system submits identity verification request.
5. If identity verification passes, system moves case to Approved for Account Creation.
6. Account creation is triggered.
7. Notification is sent to the customer.
8. Final status is stored as Completed.

Manual Review Flow

9. Identity verification returns low confidence or ambiguous failure.
10. System routes case to Manual Review queue.
11. Operations analyst reviews supporting details.
12. Analyst either approves, rejects, or requests resubmission.
13. Decision is recorded in the audit trail.

Timeout / Retry Flow

14. Verification service times out.
15. Case status becomes Verification Pending Retry.
16. Retry may be submitted by operations analyst.
17. If retry succeeds, normal flow resumes.
18. If retry fails repeatedly, escalate to Manual Review queue.

Escalation Notes

- High-priority onboarding for executive or regulated clients must be flagged for supervisor visibility.
- Repeat failures on the same request should not silently continue without review.
