

QA Test Policy

Test Design Standards

- Every requirement must have at least one positive scenario.
- Every business rule must have at least one negative scenario.
- High-risk workflows must include timeout and retry scenarios.
- Search workflows must include filter validation and empty-result behavior.
- Audit requirements must include traceability and immutability checks.

Coverage Rules

- Functional requirements require traceability to at least one test case.
- Non-functional requirements require explicit evidence or stated exclusions in the report.
- API contracts require validation for mandatory and invalid field handling.
- Error messages must be tested for clarity and actionability.

Defect Logging Rules

- Every defect must identify impacted requirement ID if known.
- Severity and priority must both be assigned.
- Repro steps must be complete enough for engineering to replicate the issue.

Exit Criteria

- No open Sev1 defects
- No open Sev2 defects in core onboarding path
- Traceability matrix completed
- Critical flows demonstrated in end-to-end testing
